

Git Hooks

This directory contains custom git hooks that automate deployment tasks.

Installation

Run the installation script to configure git to use these hooks:

```
npm run hooks:install
```

Or manually:

```
node scripts/install-git-hooks.js
```

Available Hooks

post-merge

Trigger: Runs automatically after `git pull` or `git merge`

Purpose: Automatically rebuilds the sync service when source files change

Behavior:

- Detects which files changed in the merge
- If `package.json` changed → Runs full setup (`npm run setup:update`)
- If `src/` files changed → Rebuilds service only (`npm run build:service`)
- Otherwise → Skips rebuild

Platforms:

- `post-merge` - Bash script (Linux/Mac/Git Bash)
- `post-merge.ps1` - PowerShell script (Windows)

Disabling Hooks

To temporarily disable custom hooks:

```
git config core.hooksPath .git/hooks
```

To re-enable:

```
git config core.hooksPath .githooks
```

Troubleshooting

Hooks not running after git pull

Check the hooks path configuration:

```
git config core.hooksPath  
# Should output: .githooks
```

If not set, reinstall hooks:

```
npm run hooks:install
```

Permission denied (Linux/Mac)

Make hooks executable:

```
chmod +x .githooks/post-merge
```

PowerShell execution policy (Windows)

If PowerShell hooks don't run:

```
Set-ExecutionPolicy -Scope CurrentUser -ExecutionPolicy RemoteSigned
```
